Introduction

Introduction

Computer Vision 분야에서 신경망은 어떤 패턴에 집중(attention)하여 물체 인식

- 그러나 정확한 Attention 수행이 되지 않는 경우 존재
- Attention 성능 향상을 위해 **Guided Attention Inference Network** 제안

Ex) 첫번째 이미지에서 Attention Map 에 boat가 아닌 물에 attention 영역 존재

Methodology

Methodology

: **GAIN**

Guided Attention Inference Network

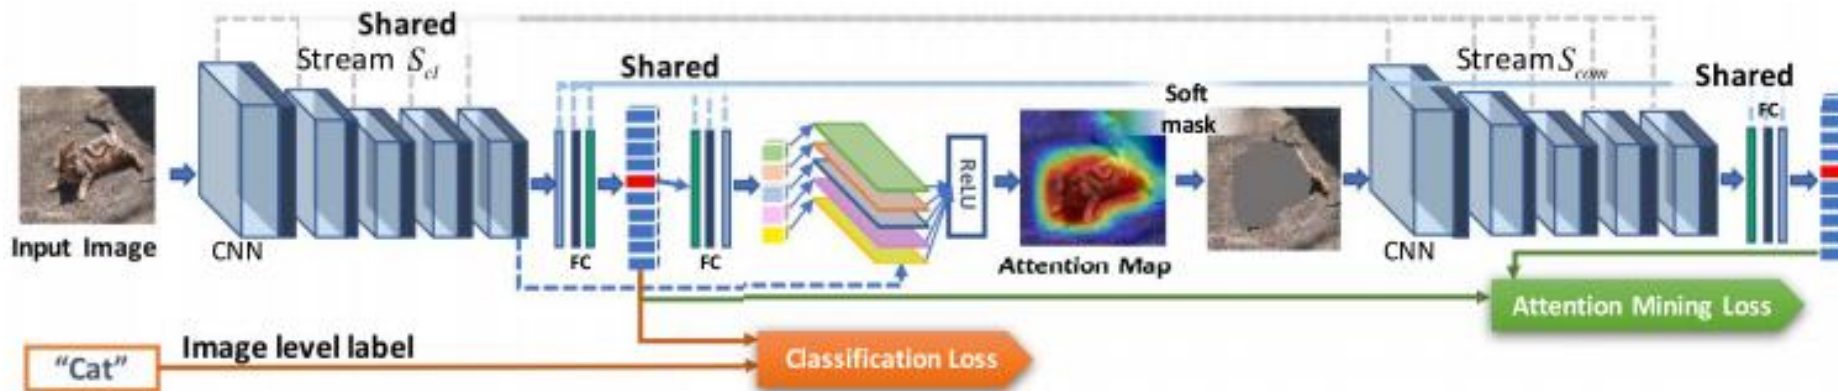

Classification 한 결과를 가지고 스스로 attention 영역을 재 학습하는 구조 (self-guidance)

Methodology

: GAIN

Guided Attention Inference Network

- 두개의 stream S_{cl} , S_{am}

S_{cl} : Class 를 인식하는 region을 찾아내는 stream

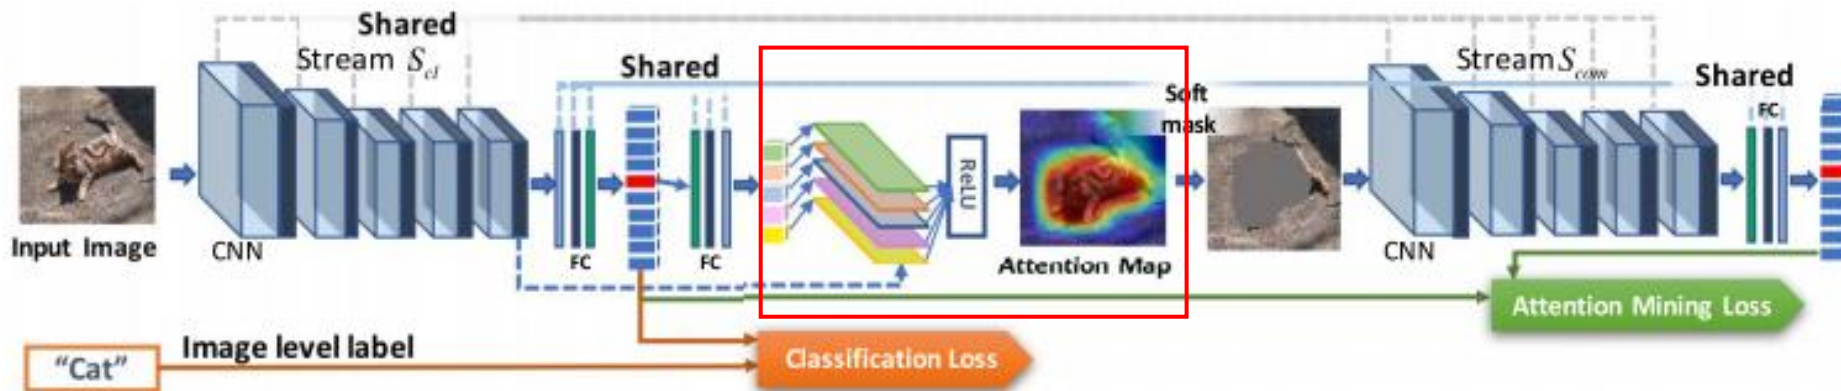

S_{am} : Classification 에 영향을 주는 모든 영역에 attention이 되도록 하는 stream

Methodology

: GAIN

Guided Attention Inference Network

- Grad-CAM 을 통해 얻은 Feature map A 와 original input image 사용

$$w_{l,k}^c = \text{GAP} \left(\frac{\partial y^c}{\partial f_{l,k}} \right)$$

$$A^c = \text{ReLU} (\text{conv} (f_l, w^c))$$

By Grad-CAM

Feature Map 과 각 요소별 gradient 의 Global Average Pooling 한 값을 Conv 하여 Attention Map 획득
ReLU 의 의미 : 같은 방향으로의 변화만을 취급
Conv(pos, pos) or Conv(neg, neg)

Guided Attention Inference Network

The diagram illustrates the proposed Attention Mining Network (AMN) architecture. It starts with an **Input Image** (a cat) being processed by a **CNN**. The output of this CNN is fed into **Stream S_{el}** , which is a **Shared** stream. This stream consists of a **Shared FC** (Fully Connected) layer. The output of this shared FC layer is used to calculate the **Classification Loss** (using the **Image level label** "Cat") and also serves as input to **Stream S_{cow}** . Stream S_{cow} is another **Shared** stream, consisting of a **Shared FC** layer. The output of this shared FC layer is used to calculate the **Attention Mining Loss**. The **Attention Mining Loss** is calculated by comparing the output of the shared FC layer in Stream S_{cow} with the **Attention Map** generated by the shared FC layer in Stream S_{el} . The **Attention Map** is generated by applying a **ReLU** activation to the output of the shared FC layer in Stream S_{el} . The **Attention Map** is then used to generate a **Soft mask**, which is used to mine the **Attention Mining Loss**.

T의 역할 : sigmoid 를 더 가파르게 만들기 위함
(1일 수록 더 1에 가깝게, 0일수록 더 0에 가깝게)

T = modified sigmoid function

σ = 모든 요소 값이 같은 threshold matrix

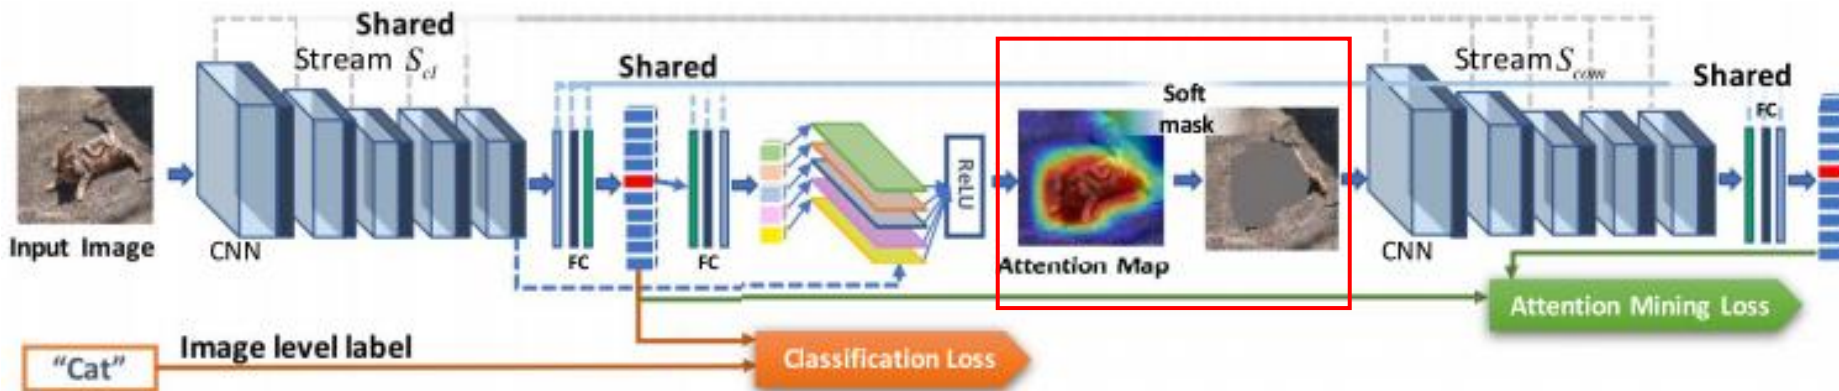

18

Methodology

: GAIN

Guided Attention Inference Network

- Masked 된 Residual Image I^{*c}

$$T(A^c) = \frac{1}{1 + \exp(-\omega(A^c - \sigma))}$$

$I^{*c} = S_{am}$ 에 사용하기 위해 soft-masked 된 Image

T = modified sigmoid function

ω = scale parameter

σ = 모든 요소 값이 같은 threshold matrix

\odot = element-wise multiplication

$$I^{*c} = I - (T(A^c) \odot I)$$

이미지에서 attention 영역을 제거

I = Original image Feature Map

$T(A^c)$ = Attention 영역이면 1, 아니면 0 return

Methodology

: GAIN

Guided Attention Inference Network

- GAIN loss function

$$L_{am} = \frac{1}{n} \sum_c (I^{*c})$$

$$L_{self} = L_{cl} + \alpha L_{am}$$

L_{cl} : Classification Loss

L_{am} : Attention Mining Loss

L_{self} : Self-guidance Loss

α : weighting parameter (fixed 1)

Methodology

: GAINext

Guided Attention Inference Network – External Version

- External stream S_e 추가
- S_{cl}, S_{am}, S_e 가 모든 파라미터를 공유

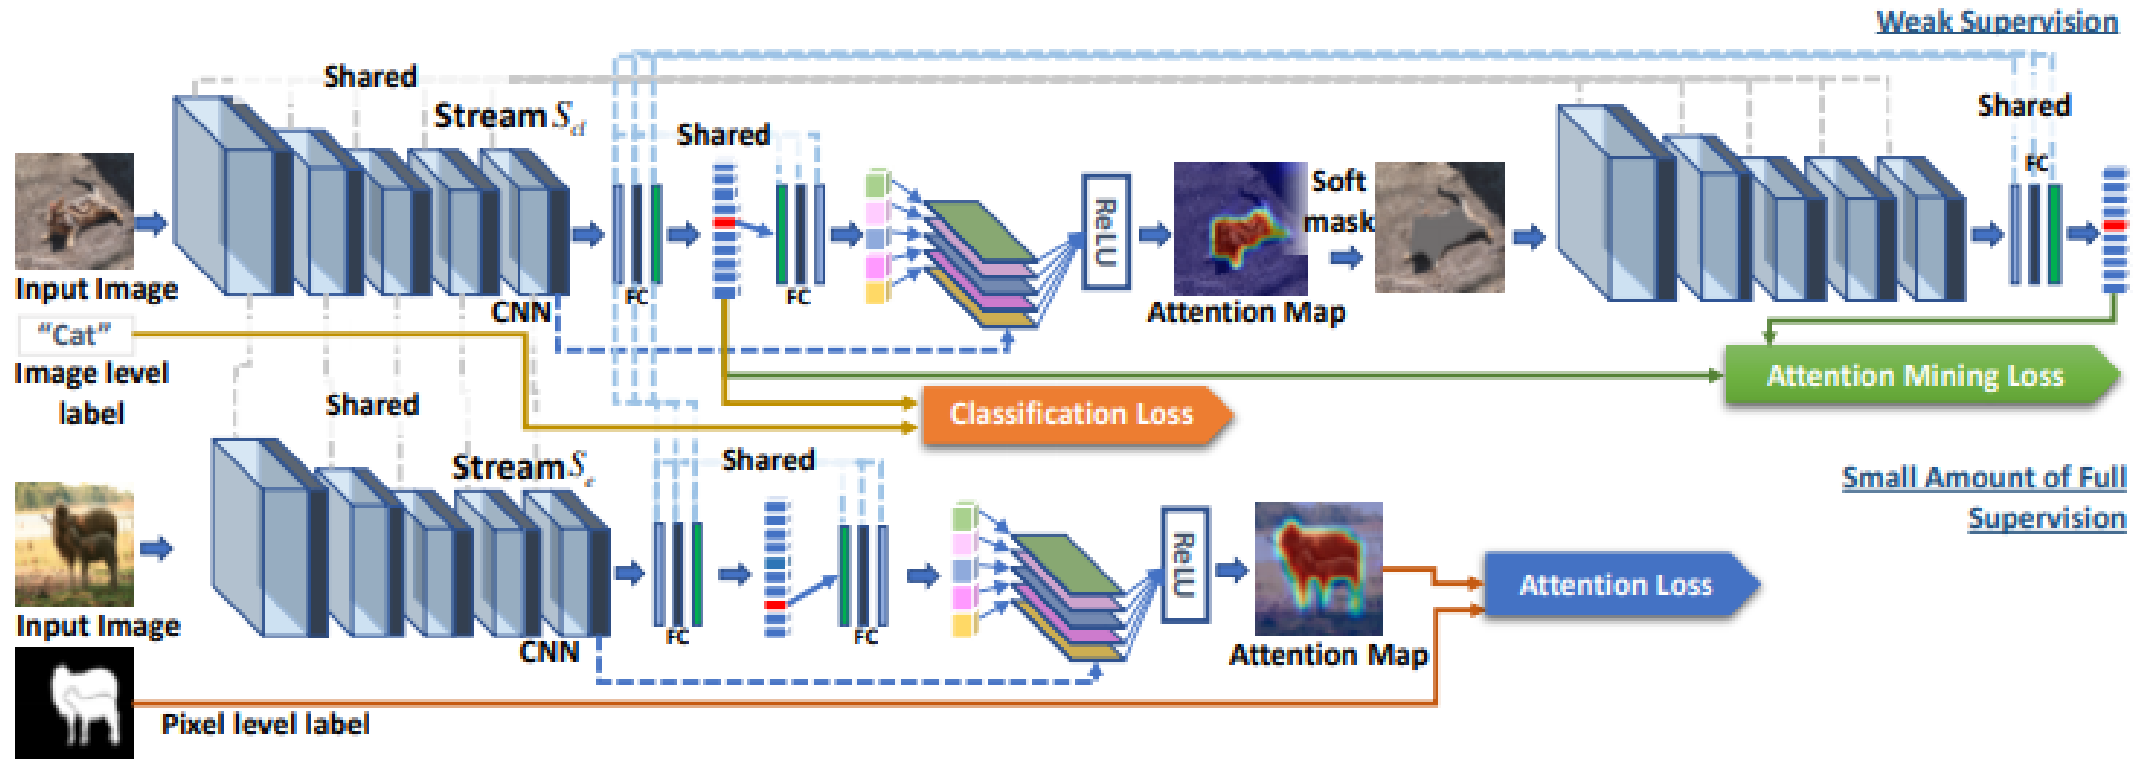

$$L_e = \frac{1}{n} \sum_c (A^c - H^c)^2$$

H_c = pixel level label

Methodology

: GAINext Framework

$$L_{ext} = L_{cl} + \alpha L_{am} + \omega L_e$$

L_{cl} : Classification Loss

L_{am} : Attention Mining Loss

L_{self} : Self-guidance Loss

α : weighting parameter (fixed to 1)

ω : weighting parameter (fixed to 10)

Semantic segmentation experiments

PASCAL VOC 2012 segmentation set

mIoU : mean Intersection over Union

Experiment

Results

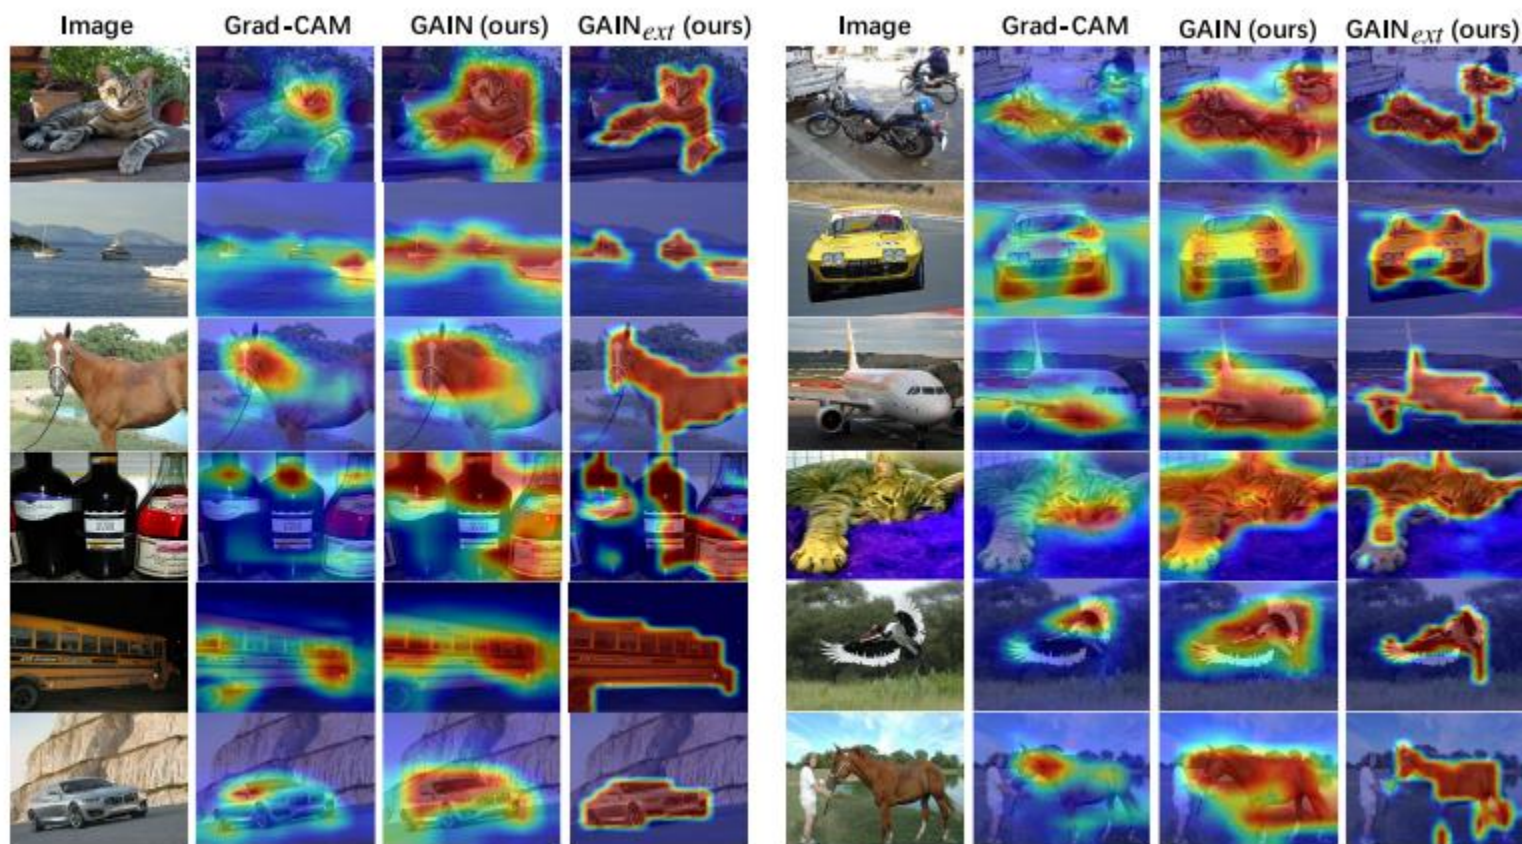

Figure 5. Qualitative results of attention maps generated by Grad-CAM [24], our GAIN and $GAIN_{ext}$ using 200 randomly selected (2%) extra supervision.

Experiment

Results

Tested on author's biased boat

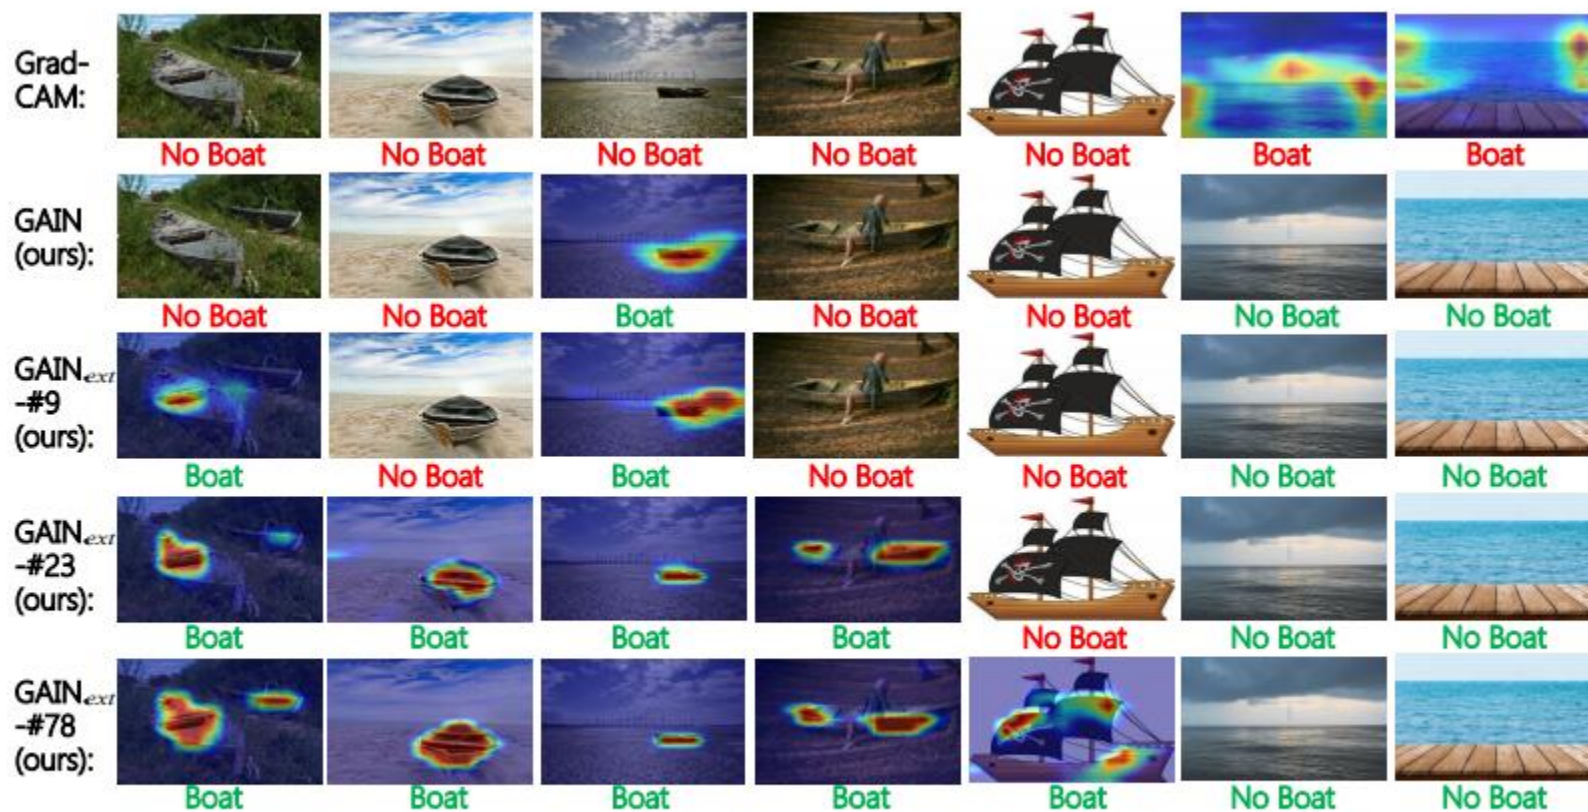

Figure 6. Qualitative results generated by Grad-CAM [24], our GAIN and GAIN_{ext} on our *biased boat* dataset. All the methods are trained on Pascal VOC 2012 dataset. -# denotes the number of pixel-level labels of *boat* used in the training which were randomly chosen from VOC 2012. Attention map corresponding to *boat* shown only when the prediction is positive (i.e. test image contains *boat*).

Experiment

Results

Tested on author's biased boat

Test set	Grad-CAM	GAIN	GAIN _{ext} (# of PL)		
			9	23	78
VOC val.	83%	90%	93%	93%	94%
Boat without water	42%	48%	64%	74%	84%
Water without boat	30%	62%	68%	76%	84%
Overall	36%	55%	66%	75%	84%

Conclusion & Discussion

Conclusion

Self-guidance, supervision 구조의 신경망으로 attention map을 더 잘 만드는 framework 제안
-> 발표당시 segmentation SOTA 성능

Contribution

- Attention map에 적용되는 지도 학습 방법 제안
- 신경망이 이미지 전체적으로 attention 을 가질 수 있도록 하는 self-guidance in training 제안
- 하나의 Framework 에서 Full supervision 이 원활하도록 supervision 과 self-guidance 를 잘 통합

Thanks
